

# STEP 1

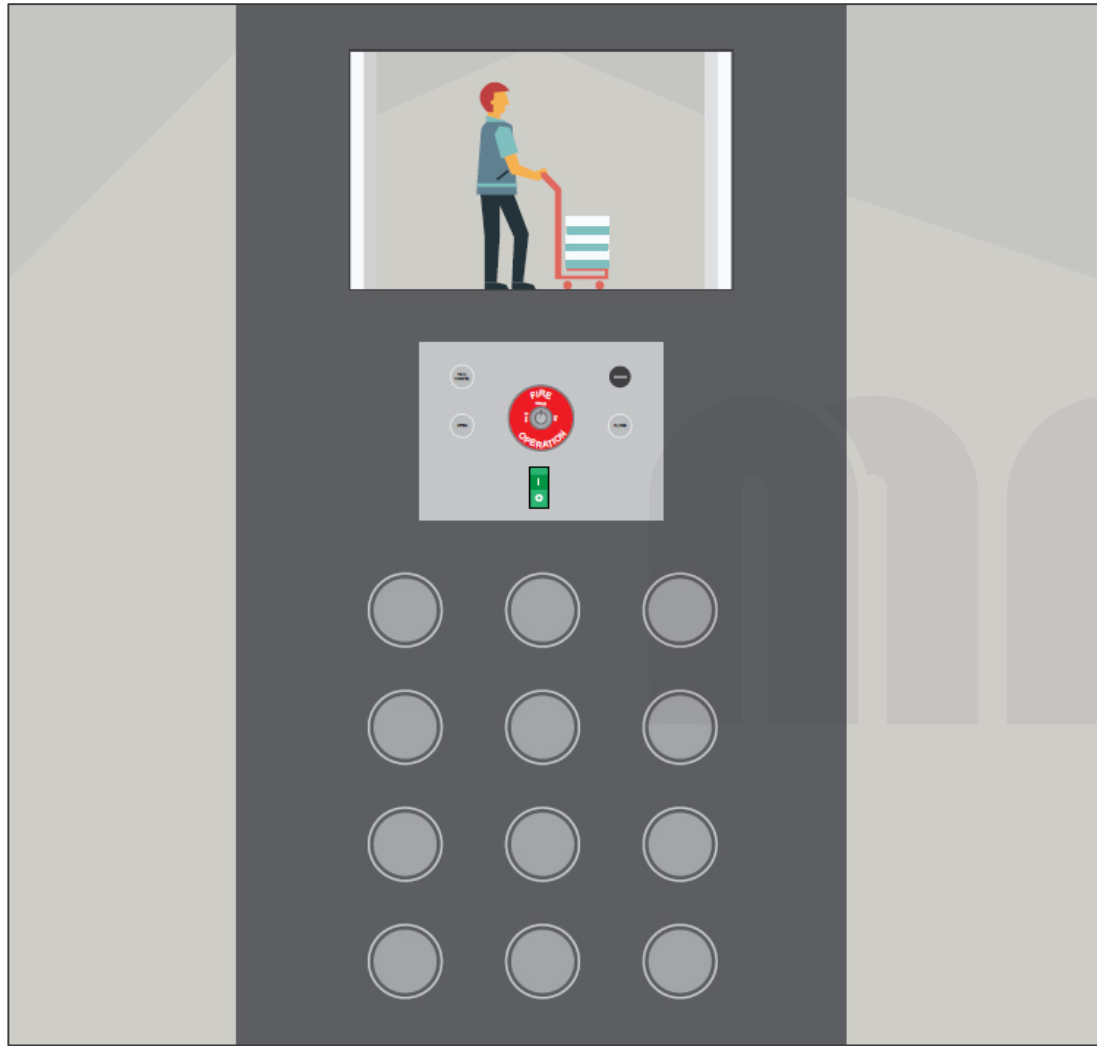

On double decker elevators, before turning the car onto Fire Service mode (Independent or Inspection), you are required to verify that the other deck is empty.

Instead of time consuming shuffle operation, video verification can be done.

## STEP 2

Using one of the toggle switches located in the Fire and/or Service cabinets, the user can activate the video of the other deck.

## STEP 3

While active, a live video of the entire car of the other deck is shown on the Matisse or TTG touchscreen.

# Technical Stuff:

What is required for this feature?

- MAD will provide and install network equipment inside the COP. Only 2 network cables (provided) will need to run between the upper and lower deck. Everything else is pre-wired at MAD.
